Nucleotides encoding methylarginase polypeptides, vectors comprising these mucleotides and the polypeptides themselves can be used in medicaments for the treatment of hyperlipidemia, renal failure, hypertension, restenosis after angioplasty, atherosclerosis, complications of heart failure, schizophrenia, multiple sclerosis or cancer. Modulators of the enzyme can be used in medicaments for the treatment of ischemia-repetfusion injury of the brain or heart, cancer, lethal hypertension in severe inflammatory conditions such as septic shock or multi-organ failure, or local and systemic inflammatory disorders including arthritis, skin disorders inflammatory cardiac disease, migraine, or microbial or bacterial infection
                                                                                                                                                                        Novel methylarginase polypeptides and polynucleotides, used to identify modulators of them, which are used in the treatment of e.g. cancer, hypertension, and bacterial infections.

Disclosure; SEQ ID NO 3; 37pp; English.

C The invention relates to a variant dimethylargonnia dimethylaminohydrolase-1 (DDAH); ADE71464) and a nucleic acid encoding confidenthylaminohydrolase-1 (DDAH); ADE71464) and a nucleic acid encoding confide, which are relevant in disorders such as cardiovascular disease and diabetes. The DDAH I gene is located on chromosome 1, which has been implicated in susceptibility to diseases such as familial combined hyperlipidaemia, premature coronary artery disease (CAD), non insulin-dependent (type 2) diabetes mellitus, and diastolic hypertension. The variant DDAH 1 of the invention has Met at position 87, rather than creased by a c to Tchange in exon 1 at a position of the invention has Met at position 87, rather than creased for the THE87Met allele have an increased risk of corresponding to base 260 in ADE71463 and ADE71465. Individuals heterocorocorresponding to base 260 in ADE71463 and ADE71465. Individuals heterocorocorresponding to base 260 in ADE71465 and ADE71465. Individuals heterocorocorpolation and appead of the complexity of a cardiovascular disease and diabetes in an individual by determining the DDAH 1 genotype; a method of trageting cardiovascular disease and diabetes in an individual vascular complications of diabetes by enhancing intric oxide availability, production or concentration; a method of targeting or that affects nitric oxide availability, production or concentration; and diabetes and its vascular complications. The methods are useful for determining the DDAH 1 genotype and treating them with a drug which elevates DDAH complexed availability or concentration (such as abletes and which elevates DDAH complexed availability or concentration (such as ablete and aduly which elevates DDAH antagonises. The methods are useful for availability or concentration (such as ablete and which elevates DDAH antagonises or also useful for determining whether a patient will be at risk of advanced or also useful for determining whether a patient will expense to a nucleic acid encoding the "wild-type" (Thr87) DD invention relates to a variant dimethylarginine

The present invention provides the protein and coding sequences of a number of human shear stress response proteins. These are useful in the diagnosis, treatment and screening of vascular diseases caused by arteriosclerosis, including heart failure, post-PTCA restenosis and Page 404-407; 678pp; Japanese. Use of genes and their expression profiles associated with osteoblast differentiation for screening modulators bone formation, for diagnosing or treating e.g. osteoporosis, or as markers for the differentiation Human; osteoblast; stem cell differentiation; bone tissue deposition; osteoporosis; osteopathic; ss. Ä Houghton Human osteoblast differentiation related cDNA SEQ ID NO 9. Claim 1; SEQ ID NO 9; 78pp + Sequence Listing; English Einstein R, Jaiswal N, Axelrod DW, Cook JS, 18-DEC-2000; 2000US-0255882P. 24-APR-2001; 2001US-0285691P. 18-DEC-2001; 2001WO-US048276 (GENE-) GENE LOGIC INC. The invention relates to genes and their expression profiles are used for: (a) screening modulators of precursor stem cell differentiation into osteoblasts, or bone tissue deposition; (b) diagnosing abnormal deposition of bone tissue, abnormal rate of osteoblast formation or osteoporosis; or (c) treating or monitoring treatment of the conditions cited in (b), or monitoring the progression of bone tissue deposition. Specific conditions include postumenopausal osteoporosis, glucocorticoid osteoporosis or male osteoporosis, osteoporosis, conditions that induced abnormalities in bone formation or bone loss, conditions that induced abnormalities in bone formation or bone loss, conditions that induced abnormalities in bone formation or bone loss, conditions skeletal disease linked to breast cancer, mastecytosis, Fanconi syndrome or fibrous dysplasia. The present sequence is that of an osteoblast of differentiation associated cDNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wippo.int/pub/published_pot_sequences

New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or WPI; 2003-075543/07. P-PSDB; ABP75492. cancers.

Claim 1; SEQ ID NO 103; 458pp + Sequence Listing; English

The invention relates to a secretory polynucleotide (designated sptm)

comprising any of 567 polynucleotide sequences (AB235837-AB226403), a

naturally occurring polynucleotide sequence at least 90% identical to

the polynucleotide sequence, a polynucleotide complementary to them or an

ENA equivalent of them. The polypeptide or polynucleotide are useful for

treating, preventing or diagnosing a disease or condition associated with

the expression of functional SPTM. These are particularly useful for

diagnosing, treating or preventing autoimmune/inflammatory disorders

(e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's

disease), neurological disorders (e.g. epilepsy, Huntington's disease,

cerebral palsy, Parkinson's disease,

multiple solerosis, cerebral palsy, Parkinson's disease,

multiple solerosis, cerebral palsy, Parkinson's disease,

solizophrenia or amnesia), or cell proliferative disorders (e.g.

psoriasis, polycythemia vera, or cancers including adenocarcinoma,

leukaemia, lymphoma, melanoma, melanoma, marchoma or cancers of the brain,

leukaemia, lymphoma, melanoma, myeloma, sarroma or cancers of the brain,

or form part of the printed specification, but was obtained in electronic

commat directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated polypeptide comprising 12 fully defined sequences of 81-615 amino acids given in the specification; a caturally occurring amino acids gequence at least 90% identical to, having 81-599 amino acids, at least 93% identical to a sequence of 529 amino acids, or at least 93% identical a sequence of 529 amino acids, at least 93% identical a sequence of 529 amino acids, at least 93% identical a sequence of 529 amino acids, all cardian in the specification; or a biologically active or immunogenic consetul in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of a drug metabolising enzyme (DME), such as autolimqune/inflammatory (e.g. albs, contact dermatitis) cell-proliferative (e.g. cancer, cirrhosis), developmental (e.g. dwarfism, hypothyroidism), endocrine (e.g. hyperlipidaemia, cystic fibrosis), contact dermatitis, hypothyroidism), endocrine, celg. osteoporosis, thrombosis, diabetes), eye (e.g. glaucoma, contactions), and about a sequence of buse in the effects of exogenous compounds on the expression of nucleic acid and compounds for expension on the expression of nucleic acid and compounds that specifically bind to or modulate the activity of the polympetides, or in altering the expression of the target polymorelection or protein interactions, drug-target interactions, and gene expression contines in gene protein interactions, drug-target interactions, and gene expression contines the polymucleotides of the invention can be used in gene therapy. This polymucleotide sequence represents the DNA encoding a drug threapy. This polymucleotide sequence represents the bund and and

11-APR-2003; 2003WO-FI000274. 19-APR-2002; 2002US-00125456.

New nucleic acid encoding a variant dimethylarginine diabetes, dimethylaminohydrolase-1 (DDAH-1) protein, useful for treating diabetes, and its vascular complications, e.g.,coronary or cerebrovascular disease WPI; 2003-854121/79.

Claim 4; SEQ ID NO 1; 37pp; English.

The invention relates to a variant dimethylarginine dimethylaminohydrolase-1 (DDAH 1; ADE71464) and a nucleic acid encoding it (ADE71463). DDAHs regulate the metabolism of ADMA (asymmetrical) it (ADE71463). DDAHs regulatly occurring nitric oxide synthase inhibitor) and intric oxide, which are relevant in disorders such as cardiovascular disease and diabetes. The DDAH 1 gene is located on chromosome 1, which as been implicated in susceptibility to disease such as familial combined hyperlipidaemia, premature coronary artery disease (CAD), non insulin-dependent (tryp 2) diabetes mellitus, and diastolic hypertension. The variant DDAH 1 of the invention has Met at position and the responding to base 260 in ADE71465 in exon 1 at a position or homozygous for the Thr87Met allele have an increased risk of developing cardiovascular diseases and diabetes. The invention also corresponding to base 260 in ADE71465 in method and kit for diagnosing a susceptibility to a cardiovascular disease and diabetes in an individual by determining the DDAH 1 genotype; a method of treating diabetes or vascular complications of diabetes by enhancing niltic oxide or concentration; a method of targeting treatment of cardiovascular disease and diabetes in a hypertensive

```
that affects nitric oxide availability, production or metabolism, and a transpanse animal which carries a human variant DDAH inucletc acid cequence. The nucleic acid molecules and polypeptides are useful for treating cardiovascular disease (e.g., coronary heart disease, complications. The methods are useful for determining whether a patient complications. The methods are useful for determining whether a patient will benefit from treatment with a drug which affects nitric oxide availability, production or metabolism, a drug which reduces ADMA availability or concentration, orn an agent which elevates DDAH availability or concentration (auch as DDAH agonist). The methods are also useful for determining whether a patient will be at risk of adverse also useful for determining whether a patient will be at risk of adverse represents a specifically claimed nucleic acid encoding the variant (Met87) DDAH in

the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.

XX RESULT 셤 ò 8

The present invention relates to nucleotide sequences which are useful the screening of compounds for the treatment of pain, or for the diagnosis of pain. The nucleotide sequences are up-regulated in the spinal cord in response to streptozocin-induced diabetes. The present sequence is one such nucleotide sequence. The invention relates to a combination comprising a number of cDNAs detecting differential expression of one or more cDNAs in a sample containing differential expression of one or more cDNAs in a sample containing mucleic acids by Mybridising a substrate with the nucleic acids, thus forming one or more hybridisation complexes, detecting hybridisation complexes, detecting hybridisation complexes, detecting standard complexes, one differences between the standard and the sample complex formation indicate differential expression of cDNAs in the sample complex formation indicate differential expression of cDNAs in the sample invention also relates to proteins and antibodies related to the cDNAs. The combination is useful for diagnosing, treating or monitoring the progression of treatment of prostate cancer. The antibodies are useful for detecting prostate cancer. This sequence represents a human prostate cancer cDNA of the invention.

Sequence 3778 BP; 1064 A; 821 C; 719 G; 1150 T; 0 U; 24 Other;

New combination comprising cDNAs that are differentially expressed in prostate cancer, useful for diagnosing, treating or monitoring the progression of treatment of prostate cancer.

Claim 1; SEQ ID NO 328; 42pp; English.

Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer.

Claim 1; Page 976-977; 2338pp; English

AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatis, cardioactive, immunomodulatory, muscular, vulnerary, gastrointesting, nephrotropic, antilifective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polymucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF15506 to AAF16514 to nvention

It is expressed in reproductive, gastrointestinal, nervous, and cardiovascular tissues. This sequence maps to chromosome 6 within the interval from 42.30 to 45.40 centimorgans (GM), to chromosome 9 within the interval from 81.00 to 92.60 cM, and to chromosome 9 within the interval from 88.10 to 92.60 cM, and to chromosome 9 within the interval from 88.10 to 92.60 cM, HyDRL antibodies, agonists and artagonists are useful for diagnosis, treatment and prevention of disorders associated with altered expression or activity of HyDRL. It includes cell proliferative disorder such as cancer, autoimmune or inflammatory disorders such as inflammation, AIDS, neurological disorder activity of disorder such as adrenoleucodystrophy. The nucleotide sequences are useful for detecting and quantifying gene expression in tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human hydrolase protein useful for diagnosing, treating and preventing cell proliferative, autoimmune and inflammatory, neurological, renal, adrenal and genetic disorders.

                                                                                                                                                                             This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have eytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AAZ52858-Z53014 represent expressed sequence tag (EST) fragments derived from a human pancreatic tumor cDNA library and which encode the proteins represented in AAY73814-Y74252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                GlyLeuGlyHisPro---SerAlaPheGlyArgAlaThrHisAlaValValArgAlaLeu

ValValCysGluGluThrAlaLeuIleThrArgProGlyAlaProSerArgArgLysGlu 101 The present invention relates to a melanoma growth related factor (MGRF-2) cDNA and protein sequence, isolated from humans. The present sequence represents the cDNA of the invention ValValGluLeuProAlaAspGluSerLeuProAspCysValPheValGluAspValAla ValaspMetMetLysGlualaLeuGluLysLeuGlnLeuAsnIleValGluMetLysAsp 3 GlyLeuGlyHisPro---SerAlaPheGlyArgAlaThrHisAlaValValArgAlaLeu 22 ProgluSerLeuCysGlnHisAlaLeuArgSerAlaLysGlyGluGluValAspValAla Human melanoma growth correlation factor and its coding sequence, preparing process and usage. Computational Analysis of Full-Length Mouse cDNAs Compared with Human Genome Sequences Mam. Genome. 12, 673-677 (2001)

Human Genome Sequences Mam. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384 format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Genoup in Riken Genomic Sciences Center and Genome Exploration Proper mouse tissues. Please visit our web site (http://genome.gsc.riken.go.jp) for further details.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            134 Argaccadecricadecadeceredecriredecedadecadecadedadeceradadededederi 193

/ note="Organ: brain; Vector: pYX-Asc; Site 1: EcoR I;
Site 2: Not I; The library was constructed_according to
Bonaldo, Lennon and Soares, Genome Research, 6:79-86,
1996. Denatured mRMs was size fractionated on a 1% agarose
gel: First strand CDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
clond of primer containing a Not I site. Double stranded
clond directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyk
tail, is GTGCTGGAA. This library was created for the
University of Iowa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery in the Developing Mouse Nervous
System', supported by National Institutes of Mental Health
(NIMH), Hemin Chin, Ph.D., program coordinator."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Published Applications NA:*

                                                                                                                                                                                                                                                                                                                                                                                                                                          // hote-*/ Amidinotransf, Region: Amidinotransferase. This family moterans glycine (EC:2.1.4.1) and incosamine (EC:2.1.4.2) amidinotransferases, enzymes involved in creatine and streptomyonin biosytthesis respectively. This family also includes arginine deiminases, EC:3.5.3.6. These enzymes catalyse the reaction: arginine + H2O <=> citrulline + NH3. Also found in this family is the /db_xref="CDD:pfam02274"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        478 GATGGCGGAGATGTTTTTTTATTCACAGGCAGAGAATTTTTTGTGGGCCTTTCCAAAAGACA

         Neuherberg, GERMANY
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DRFZ); Emails.wiemann@dkiz.heidelberg.de;
sequenced by EMBL (Buropean Molecular Biology Laboratories,
Heidelberg/Germany) within the cDNA sequencing consortium of the
German Genome Project.
This clone (DKFZp686N2176) is available at the RZPD in Berlin.
Please contact the RZDD: Ressourcenzentrum, Heubnerweg 6, 14059
Berlin-Charlottenburg, GERWANY; Email: clone@rzpd.de Further

Amidinotransf; Region: Amidinotransferase. This family contains glycine (BC:2.1.4.1) and inceamine family contains glycine (BC:2.1.4.1) and inceamine (BC:2.1.4.2) amidinotransferases, enzymes involved in creatine and streptomycin blosynthesis respectively. This family also includes arginine deiminases, BC:3.5.3.6. These enzymes catalyse the reaction: arginine + H2O <=> ctrulline + NH3. Also found in this family is the  ctrop: ctrop: pfam02274"

It currently consists of 8 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 38 concids. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Web site: http://www.seq.wi.mit.edu

As Durnelly. Submission

Normelly. Submission

Submitted (27-FEB-2011) Sanger Centre, Hinxton, Cambridgeshire, CB10 18A, W. B-mail enquirides: humquery@sanger.ac.uk CDne requests: clonerequestescanger.ac.uk

On or before May 15. 2001 this sequence version replaced gi:9958163, gi:10218064.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence are finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chanistry or covered by high quality data (i.e., phred quality) = 30); an attempt was made to resolve all sequencing problems, such a sembly was confirmed by restriction digest. The following absentiations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMEL; Sw:, SwiSSPROT; Tr., TREMBL; Mp:, WORNPEP; Information on the WORNEP database can be found at the primary accession numbers given thep://www.sanger.ac.uk/HOP/Christion are used to associate primary accession in the feature table with their source databases: Em:, EMEL; Sw:, SwiSSPROT; Tr., TREMBL; Mp:, WORNPEP; Information on the WORNEP database can be found at contrapt of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of primary of the true left end of clone RPH-131123 is at 109993 in this sequence.                                                                                                                                                                                                  Nucleotides encoding methylarginase polypeptides, vectors comprising these mucleotides and the polypeptides themselves can be used in medicaments for the treatment of hyperlipidemia, renal failure, hypertension, restenosis after angioplasty, atherosolerosis, complications of heart failure, schizophrenia, multiple sclerosis or cancer. Modulators of the enzyme can be used in medicaments for the treatment of ischemia-reperfusion injury of the brain or heart, cancer, lethal hypertension in severe inflammatory conditions such as septic shock or multi-organ failure, or local and systemic inflammatory disorders including arthritis, skin disorders, inflammatory cardiac disease, migraine, or microbial or bacterial infection
                                                                                                         Novel methylarginase polypeptides and polynucleotides, used to identify modulators of them, which are used in the treatment of e.g. cancer, hypertension, and bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GATGAAAATGCAACTTTAGATGGCGGAGATGTTTTATTCACAGGCAGAGAATTTTTTGTG

                                                                                                                          C The Invention relates to a variant discreptaginine discreptation relates to a variant discreptaginine discrete and another processing of ADMA (asymmetrical discreptation). DDAHs regulate the metabolism of ADMA (asymmetrical discreptation). DDAHs regulate the metabolism of ADMA (asymmetrical and nitric oxide, which are relevant in disorders such as cardiovascular disease and diabetes. The DDAH I gene is located on chromosome 1, which has been implicated in susceptibility to diseases such as familial combined hyperlipidaemia, premature coronary artery disease (CAD), non the subject of the invention has Met at position of the invention has Met at position and the invention and the is caused by a c to T change in exon 1 at a position. The, which is caused by a c to T change in exon 1 at a position of corresponding to base 260 in ADE71465 and ADE71465. Individuals heterocorresponding to base 260 in ADE71465 and ADE71465. Individuals heterocorresponding to base 260 in ADE71465 and ADE71465. Individuals heterocorresponding to base 260 in ADE71465 and ADE71465. Individuals heterocorresponding to base 260 in ADE71465 and ADE71465. Individuals heterocorresponding to base 260 in ADE71465. Individuals heterocorresponding to acadiovascular disease and diabetes. The invention also susceptibility to a cardiovascular disease and diabetes in an individual vacular complications of diabetes by enhancing mitric oxide cardiovascular disease and diabetes in an individual vacular complications of diabetes by enhancing mitric oxide availability, production or concentration; a method of targeting cordiovascular disease (e.g., coronary heart disease, corpusors or treating cardiovascular disease (e.g., coronary heart disease, diabetes and tiebetes are useful corpusionations. The methods are useful for determining whether a patient which elevates DDAH antagonists are administered. The present sequence of effects if DDAH antagonists are administered. The present sequence effects if DDAH antagonists are administered. The present sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Seguence 858 BP; 218 A; 213 C; 258 G; 169 T; 0 U; 0 Other;

The invention relates to genes and their expression profiles are used for: (a) screening modulators of precursor stem cell differentiation into osteoblasts, or bone tissue deposition; (b) diagnosing abnormal costeoblasts, or bone tissue abnormal rate of osteoblast formation or osteoporosis; or of treating or monitoring treatment of the conditions cited in (b), or monitoring the progression of bone tissue deposition. Specific conditions include postmenopausal osteoporosis, glucocorticoid osteoporosis or male osteoporosis, osteopenia, osteodystrophy, druginduced abnormalities in bone formation or bone loss, conditions that include abnormalities in bone formation or bone loss, conditions that include abnormalities in bone formation or bone loss, conditions that involve altered bone metabolism (e.g. idiopathic juvenile osteoporosis), skeletal disease linked to breast cancer, mastecoytosis, Fanconi syndrome or fibrous dysplasia. The present sequence is that of an osteoblast differentiation associated CODM marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         401 chachcacachtahahacachahadachahadatahadahadahadachadada 460

New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or cancers.

Claim 1; SEQ ID NO 103; 458pp + Sequence Listing; English.

The invention relates to a secretory polymucleotide (designated sptm)

Comprising any of 567 polymucleotide sequences (AB235837-AB236403), a

comprising any of 567 polymucleotide sequence at least 90 % identical to

the polymucleotide sequence, a polymucleotide complementary to them or an

Comparison of them. The polypeptide or polymucleotide are useful for

RNA equivalent of them. The polypeptide or polymucleotide are useful for

Comparison of functional SPTM. These are particularly useful for

the expression of functional SPTM. These are particularly useful for

Comparison of functional SPTM. These are particularly useful for

Comparison of functional SPTM. These are particularly useful for

The invention relates to an isolated polypeptide comprising 12 fully defined sequences of 81-615 amino acids given in the specification; a naturally occurring amino acid sequence at least 90% identical to, having acids, at least 93% identical to a sequence of 529 amino acids, at least 93% identical to a sequence of 529 amino acids, at least 93% identical to a sequence of 615 amino acids, all given in the specification; or a biologically active or immunogenic fragment of the polypeptide. The polypeptides and polymorleotides are useful in diagnosing treating and preventing diseases or conditions associated with the decreased expression or overexpression of a drug metabolising enzyme (DME), such as autoimmune/inflammatory (e.g. AIDS, athexosclerosis, contact dermatitis) cell-profiferative (e.g. Lancer, cirrhosis), developmental (e.g. diabetes), eye (e.g. glaucoma, extending comportic (e.g. hyperlipidaemia, cystic fibrosis), control (e.g. hyperlipidaemia, cystic fibrosis), destroint estinal (e.g. gastroenteritis, diarrhoea), or liver (e.g. hepatitis), metabolic (e.g. hyperlipidaemia, cystic fibrosis), control (e.g. gastroenteritis, diarrhoea), or liver (e.g. dastroint estinal (e.g. gastroenteritis, diarrhoea), or liver (e.g. perfects of exogenous one).

CC hepatitis, Reye's syndrome) disorders. These are also useful in assessing compounds for effects of more one of the target polymorleocide and compounds that specifically bind to or modulate the activity of the polympetide. The microarray is useful in monitoring or measuring protein-profiles. The polymucleotides of the invention can be used in gene expression the polymucleotides of the invention and be used in gene profiles. The polymucleotides of the invention and be used in gene

acids, thus forming one or more hybridisation complexes, detecting thy bridisation complexes, detecting thy bridisation complexes, detecting station complex formation and comparing the complexes formed with standard complexes, where differences between the standard and the sample complex formation indicate differential expression of cDNAs in the sample assume. The differential expression is diagnostic of prostate cancer. The invention also relates to proteins and antibodies related to the cDNAs. The combination is useful for diagnosing, treating or monitoring the progression of treatment of prostate cancer. The antibodies are useful for detecting prostate cancer. The antibodies are useful for detecting prostate cancer. This sequence represents a human prostate cancer cDNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cyrostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynuclacities may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. WPI; 2003-854121/79. P-PSDB; ADE71464.

New nucleic acid encoding a variant dimethylarginine dimethylaminohydrolase-1 (DDAH-1) protein, useful for treating diabetes, and its vascular complications, e.g. coronary or cerebrovascular disease or hypertension.

Claim 4; SEQ ID NO 1; 37pp; English

The invention relates to a variant dimethylarginine dimethylarginine of dimethylaraninohydrolase-I (DDAH 1; ADB71464) and a nucleic acid encoding it (ADB71463). DDAHS regulate the metabolism of ADMA (saymmetrical dimethyl-arginine; a natuarlly occurring nitric oxide synthase inhibitor) and nitric oxide, which are relevant in disorders such as cardiovacular disease and diabetes. The DDAH 1 gene is located on chromosome 1, which combined hyperlipidaemia premature cornary arrery disease (CAD), non insulin-dependent (type 2) diabetes mellitus, and diascolic hypertension. Thr. which is caused by a C to T change in exon 1 at a position corresponding to base 260 in ADB71463 and ADB71465. Individuals heterocreated to a DDAH 1 cDMA capture probe, a method and kit for diagnosing a cusceptibility to a cardiovacular disease and diabetes. The invention also cardiovacular disease and diabetes in an individual by determining the DDAH 1 genotype; a method of treating diabetes or susceptibility to a cardiovacular disease and diabetes in an individual by determining the DDAH 1 genotype; a method of treating diabetes or vailability, production or concentration; a method of targeting cardiovacular disease and diabetes in an individual by determining the DDAH 1 genotype and treating them with a drug which affects mitric oxide availability, production or concentration; a method of targeting cardiovacular disease (e.g., coronary heart disease, cerebrovacular disease, and hypertension), and diabetes and its vascular complications. The methods are useful for determining whether a patient will benefit from treatment with a drug which affects nitric oxide availability, production or metabolism, a drug which elevates DDA

The nucleotide sequences are up-regulated in the spinal cord in response to streptozocin-induced diabetes. The present sequence is one such nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 65 LeuproAlaAspGluSerLeuproAspCysValPheValGluAspValAlaValValCys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                624 CTGCCGGCCGACGAGGAGCCTGCCTGACTGCGTGTTCGTGGAGGACGTGGCCGTGTGTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           124
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                803

The invention relates to genes and their expression profiles are used for: (a) screening modulators of precursor stem cell differentiation into esteoblasts, or bone tissue deposition, (b) diagnosing abnormal deposition of bone tissue, abnormal rate of osteoblast formation or osteoporosis; or (c) treating or monitoring treatment of the conditions cited in (b), or monitoring the progression of bone tissue deposition. Specific conditions include postemenopausal osteoporosis, gluccorticoid osteoporosis or male osteoporosis, osteoporosis, drug-

induced abnormalities in bone formation or bone loss, conditions that involve altered bone metabolism (e.g. idiopathic juvenile osteoporosis), skeletal disease linked to breast cancer, mastocytosis, Fanconi syndrome or fibrous dysplasia. The present sequence is that of an osteoblast differentiation associated cDNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

SM. (HUMA-) HUMAN GENOME SCI INC Barash SC, Rosen CA,

WPI; 2001-541565/60.

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Disclosure, SEQ ID NO 6973; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or amaliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosists, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urbgenital; (b) immune disorders e.g. Addison's disease, allergies, untoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c)

```
cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

(HUMA-) HUMAN GENOME SCI INC

Barash SC, Rosen CA,

WPI; 2001-541565/60

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Disclosure, SEQ ID NO 6972, 1701pp + Sequence Listing, English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins

(ABB14678-ABB18001) useful for preventing, treating or ameliorating

medical conditions e.g. by protein or gene therapy. The genes are
isolated from a range of human tissues disclosed in the specification.

The nucleic acids, proteins, antibodies and (ant) agonists are useful in

the disgnosis, treatment and prevention of: a cancer, e.g. breast and

ovarian cancer and other cancers of the adrenal gland, bone, bone marrow,

breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune

disorders e.g. Addison's disease, allergies, autoimmune haemolytic

anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease,

multiple sclerosis, rheumatoid arthritis and ulcerative colifis; (c)

cardiovascular disorders such as myocardial ischaemias; (d) wound healing

(e) neurological diseases such as viral, bacterial, fungal and parasitic

infectious diseases such as viral, bacterial, fungal and parasitic

the printed specification, but was obtained in electronic format directly

from WIPO at ftp.wipo.int/pub/published\_pot\_sequences

```
The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTs sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dry primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

 Computational Analysis of Full-Length Mouse cDNAs Compared with Human Genome Sequences Mamm. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare [ull-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a norredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)

CNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to

First strand cDNA synthesis was primed with an oligo-dr primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CAPCTCTACT. This library was created for the University of Iowa Program for Rat Gene Discovery and Mapping (Val Sheffield, Bento Soares and Tom Casavant)"
